

Your New Look Starts Here

Thank you for choosing Hipshot® tuning machines for your guitar. We know instruments are supposed to be about tone but let's face it, appearance is important too! That's why we offer a wide variety of easy-to-install buttons that match your personal style. Enjoy!

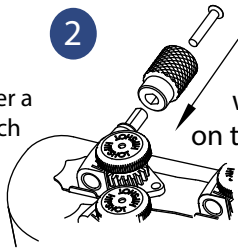

Follow these steps on each tuner one at a time.

- 1** Tune the string down until it's completely slack. Use a #1 phillips screwdriver to remove the button screw then pull off the button.

Be sure washers remain on the shaft. Nylon goes first then steel.

- 2** Line up internal flats on the new button with the external flats on the tuning shaft. Push the button onto the tuning shaft then install the new screw.

- 3** Adjust the tightness of the button screw while feeling the tension of the button. The tighter the button screw is, the more resistance you'll feel while tuning. Once you're happy with the feel of the machine head, bring the string back up to pitch.
